ABSTRACT

An absorbent article, such as a diaper, containing cuffs with a skin care composition disposed thereon. In one embodiment the cuff is a nonwoven leg cuff comprising spunbonded nonwoven material and characterized by the lack of a meltblown component, the nonwoven material having a basis weight of about 17 gsm and a hydrostatic head of at least about 95 mm. The spunbonded material comprises metallocene polypropylene fibers having a denier of less than about 1.3. In another embodiment, small amounts of meltblown fibers, for example, up to about 10% by weight, can be added to the metallocene polypropylene spunbonded material to increase production rates of the nonwoven material, without an unacceptable decrease in skin health benefits. The skin care composition disposed on the cuffs is transferable to the wearer's skin by normal contact and/or wearer motion and/or body heat. The skin care compositions disclosed in the present invention are selected to maintain and/or improve the skin health of the wearer upon transfer during use, for example, to provide a skin protective barrier or a therapeutic benefit; to minimize the abrasion between the cuffs and skin in the area where the cuffs contact the wearer's skin, resulting in less skin irritation; to improve BM clean up on the skin, or to improve the barrier properties of the cuffs.
